1. Safety

Knowledge of the operating instructions is a prerequisite for equipment operation.

1.1 Symbols Used

The following symbols are used in this instruction manual:

- **CAUTION**: Indicates a hazardous situation which, if not avoided, may result in minor or moderate injury.

- **NOTICE**: Indicates a situation that may result in property damage if not avoided.

- **>**: Indicates a user action.

- **i**: Indicates a tip for users.

1.2 Warnings

- **CAUTION**: Disconnect the power supply before touching the sensor surface.
  - Risk of injury
  - Static discharge

- **NOTICE**: Connect the power supply and the display/output device in accordance with the safety regulations for electrical equipment.
  - Risk of injury
  - Damage to or destruction of the sensor and/or controller

- **NOTICE**: Avoid shocks and impacts to the sensor and controller.
  - Damage to or destruction of the sensor and/or controller

- **NOTICE**: The power supply must not exceed or continuously fall below the specified limits.
  - Damage to or destruction of the sensor and/or controller
Protect the sensor cable against damage
> Destruction of the sensor
> Failure of the measuring device

1.3 Notes on CE Marking

The following apply to the capaNCDT 6110 / 6120:
- EU directive 2014/30/EU
- EU directive 2011/65/EU, "RoHS" category 9

Products which carry the CE mark satisfy the requirements of the EU directives cited and the European harmonized standards (EN) listed therein. The EU Declaration of Conformity is available to the responsible authorities according to EU Directive, article 10, at:

MICRO-EPSILON Messtechnik GmbH & Co. KG
Königbacher Straße 15
94496 Ortenburg / Germany

The measuring system is designed for use in industrial environments and meets the requirements.
1.4 Intended Use
- The capaNCDT 6110 / 6120 measuring system is designed for use in industrial areas. It is used for
  - displacement, distance, thickness and movement measurement
  - position measuring of parts or machine components
- The system must only be operated within the limits specified in the technical data, see Chap. 2.3.
- The system must be used in such a way that no persons are endangered or machines and other material
  goods are damaged in the event of malfunction or total failure of the system.
- Take additional precautions for safety and damage prevention in case of safety-related applications.

1.5 Proper Environment
- Protection class: IP 40
- Operating temperature:
  - Sensor:  -50 ... +200 °C (-58 to +392 °F)
  - Sensor cable:  -100 ... +200 °C (-58 to +392 °F) (CCx, CCx/90, CCmx and CCmx/90)
                  -20 ... +80 °C (-4 to 176 °F) (CCgx and CCgx/90 - permanently)
                  -20 ... +100 °C (-4 to 212 °F) (CCgx and CCgx/90 - 10,000 h)
  - Controller:  +10 ... +60 °C (-50 to +140 °F)
- Humidity: 5 - 95 % (non-condensing)
- Ambient pressure: Atmospheric pressure
- Storage temperature:
  - Sensor:  -50 ... +200 °C (-58 to +392 °F)
  - Sensor cable:  -50 ... +200 °C (-58 to +392 °F) (CCx, CCx/90, CCmx und CCmx/90)
                -50 ... +80 °C (-58 to +176 °F) (CCgx and CCgx/90)
  - Controller:  -10 ... +75 °C (+14 to +167 °F)
- The space between the sensor surface and the target must have an unvarying dielectric constant.
- The space between the sensor surface and the target may not be contaminated (for example water,
  rubbed-off parts, dust, etc.).
2. **Functional Principle, Technical Data**

2.1 **Measuring Principle**

The principle of capacitive distance measurement with the capaNCDT system is based on the principle of the parallel plate capacitor. For conductive targets, the sensor and the target opposite form the two plate electrodes.

If a constant AC current flows through the sensor capacitor, the amplitude of the AC voltage at the sensor is proportional to the distance between the capacitor electrodes. The AC voltage is demodulated, amplified and output as an analog signal.

The capaNCDT system evaluates the reactance $X_C$ of the plate capacitor which changes strictly in proportion to the distance.

$$X_C = \frac{1}{j\omega C}; \quad \text{capacitance } C = \varepsilon_r \cdot \varepsilon_0 \cdot \frac{\text{area}}{\text{distance}}$$

A small target and bent (uneven) surfaces cause a non-linear characteristic.

This theoretical relationship is realized almost ideally in practice by designing the sensors as guard ring capacitors.

The linear characteristic of the measuring signal is achieved for electrically conductive target materials (metals) without any additional electronic linearization. Slight changes in the conductivity or magnetic properties do not affect the sensitivity or linearity.
2.2 **Structure**

The non-contact, single-channel measuring system of capaNCDT 6110 / 6120, installed in an aluminum housing, consists of:
- Controller
- Sensor
- Sensor cable
- Power supply and signal cable

The signal processing electronics with oscillator, demodulator, AD converter and integrated preamplifier is in the controller 1.

### 2.2.1 Sensors

For this measurement system, several sensors can be used.

![Measuring surface sensor](image)

In order to obtain accurate measuring results, keep the surface of the sensor clean and free from damage.

The capacitive measuring process is area-related. A minimum area, see Fig. 5, is required depending on the sensor model and measuring range.

2.2.2 Sensor Cable
Sensor and controller are connected by a special, double screened sensor cable. Do not shorten or lengthen these special cables. Usually, a damaged cable can not be repaired.

**NOTICE**
Switch off the device when plugging and removing connectors.
Do not crush the sensor cable.
Do not modify to the sensor cable.
> Lost of functionality
2.2.3 Controller

The capaNCDT 6110 / 6120 contains a voltage processing, oscillator, integrated preamplifier, demodulator as well as an output level.

The voltage processing produces all necessary internal voltages from the power supply. The oscillator supplies the sensor with frequency and amplitude-stabilized alternating voltage. The frequency is 31 kHz. The internal preamplifier generates the distance-dependent measuring signal and amplifies it. Demodulator and output level convert the measuring signal into a standard voltage signal.

**Notice**

The output voltage can reach up to a maximum of 13 VDC when sensor is disconnected or measurement is exceeded.

> Damage to downstream devices

3. **Delivery**

3.1 **Unpacking**

1 Controller
1 Power supply and output cable SCAC3/5 (DT6110) or SCAC3/6 (DT6120)
1 Instruction Manual

Optional accessories:
1 Sensor
1 Sensor cable with connector
1 IF1032/ETH interface converter from analog (DT6110) or RS485 Ethernet (DT6120) on Ethernet/Ether-CAT

Further optional accessories, see Chap. A 1

> Remove the parts of the system carefully from the packaging and transport them in such a way that they are not damaged.

> Check for completeness and shipping damages immediately after unpacking. In case of damage or missing parts, please contact the manufacturer or supplier.

3.2 **Storage**

- Storage temperature:
  - Sensor: -50 ... +200 °C (-58 to +392 °F)
  - Sensor cable: -50 ... +200 °C (-58 to +392 °F) (CCx, CCx/90, CCmx and CCmx/90)
  - Controller: -10 ... +75 °C (+14 to +167 °F)
- Humidity: 5 - 95 % RH (non-condensing)
4. Installation and Assembly

4.1 Precautionary Measures

No sharp-edged or heavy objects may get into contact with the sensor cable sheath.

- Protect the cable against pressure loads in pressurised rooms.
- Avoid kinks in any case.
- Check the connections for tight fit.

A damaged cable cannot be repaired.

4.2 Sensor

The sensors may be mounted free-standing or flush.

When assembling, make sure that the polished sensor surface is not scratched.

4.2.1 Radial Point Clamping, Circumferential Clamping, Cylindric Sensors

This simple type of fixture is only recommended for a force and vibration-free installation position.

The grub screw must be made of plastic so that it cannot damage or deform the sensor housing.

Do not use metal grub screws!

> Danger of damaging the sensor
This sensor mounting option offers maximum reliability because the sensor is clamped around its cylindrical housing. It is absolutely necessary in difficult installation environments, for example on machines, production plants et cetera.

![Circumferential clamping with clamping ring](image)

Fig. 8 Circumferential clamping with clamping ring

A circumferential clamping possible from 2 mm behind the front face.

- Tension at the cable is inadmissible!

4.2.2 Mounting with Thread, Series CSE\textit{x}/Mx Sensors

For holders with an internal thread, a mounting nut is sufficient for attaching the sensor. For thin holders, Micro-Epsilon recommends mounting nuts on both sides for mounting. Attach the sensor preferably at the end of the thread towards the active measuring surface. Please note the maximum torque, see Fig. 11.

![Mounting with thread](image)

Fig. 9 Mounting with thread

▲ ▲ Active measuring surface sensor, ▲ connector side
4.2.3 Flat Sensors

Screwing from above

Screwing from bottom

Flat sensors are mounted by means of a tap hole for M2 (in case of sensors 0.2 and 0.5 mm) or by a through hole for M2 screws. The sensors can be bolted on top or below.

Fig. 10 Mounting flat sensors

Active measuring surface sensor
4.3 Sensor Cable

4.3.1 General

The sensor is connected to the controller by the sensor cable. The connection is made by simple plugging. The connector locks automatically. The tight fit can be checked by pulling the connector housing (cable bushing). The lock can be released and the connector can be opened by pulling the knurled housing sleeve of the cable bushing.

4.8 Sensor Connection

Fig. 22 Connection sensor cable
5. RS485 Interface

The RS485 interface is only present with the DT6120. You can read the measuring values in digital form via the RS485 interface. MICRO-EPSILON supports you with the driver MEDAQLib, which contains all commands for the capaNCDT 6120. You can download the driver directly under the link http://www.micro-epsilon.de/link/software/medaqlib.

You can also use the IF1032/ETH interface converter, see Chap. A 1, for the configuration and reading of the measuring values via Ethernet.

5.1 Hardware Interface

The interface is a half-duplex RS485 interface (1 common line pair for Rx and Tx).

- Baud rate: 230400 (other baud rates adjustable)
- Data format: 1 start bit, 8 data bits, 1 parity bit (straight), 1 stop bit
- RS485 Address: 126 (1 … 126 adjustable)

In controller there is no RS485 terminal resistance. For RS485 cables longer than 5 meters a terminal resistance of 120 Ohm between the A and the B line both at the bus start and end is necessary.

5.2 Protocol

The capaNCDT 6120 behaves like a RS485-Slave. Since it is a halfduplex protocol, only the Master can initiate a communication. Each device on the RS485 bus requires a RS485 address. The master sends a request with address on the bus and only the Slave with the address then responds to the request.
5.2.1 Reading Measuring Values

Master: Request Data

<td>0x16</td>
</tr>
</tbody>
</table>

Abbreviations:

- **SD**: StartDelimiter (0x10: telegram without data; 0x68 telegram with variable length)
- **LE**: Length (number of bytes without SD, LE, LErep, SDrep, FCS, ED)
- **LErep**: LE repeated
- **SDrep**: SD repeated
- **DA**: Destination Address (default 0x7E)
- **SA**: Source Address (e.g. 0x01)
- **FC**: Function Code
- **FCS**: Checksum (sum of all bytes without SD, LE, LErep, SDrep, FCS, ED; without overflow, only 8 bits)
- **ED**: EndDelimiter

**Data[]**: Measuring data (little endian)
The measuring data consists of a counter, the packet length m and the measuring values. The packet length m determines how many measuring values are transmitted. The packet length m is the number of measuring values sampled from the electronic, since the last request of measuring data, but is limited to the last 20 measuring values. The first measuring value in the data[] packet is the oldest value sampled, the last is the newest value sampled.

| Data[0]  | Counter [7:0]       | unsigned short |
| Data[1]  | Counter [15:8]      |               |
| Data[2]  | Packet length m [7:0] |               |
| Data[3]  | Filler byte [7:0]   |               |
| Data[8]  | Measuring value 2 [7:0]       |               |
| ...      |                     |               |
| Data[..] | Measuring value m [7:0]     |               |
| Data[..] | Measuring value m [15:8]    |               |
| Data[..] | Measuring value m [23:16]   |               |
| Data[..] | Measuring value m [31:24]   |               |

5.2.2 Scaling the Measuring Values

By default, 24-bit measuring values are transmitted. That is why:

- \(0x0\) = 0 % of sensor measuring value
- \(0xF0000\) = 100 % of sensor measuring value

If the sensor is out of measuring range, so correspondingly larger measuring values are output.
5.2.3 Example of the Measuring Value Transmission

Master: Request Data

<table>
<thead>

</tr>
<tr>
<td>Data[14] 0x32</td>
<td>Measuring value 3 [23:16]</td>
<td></td>
</tr>
<tr>
<td>Data[15] 0x00</td>
<td>Measuring value 3 [31:24]</td>
<td></td>
</tr>
</tbody>
</table>

A total of 3 measurement values (= m) were added since the last measuring value request in controller and transferred thereby.
5.2.4 Setting the RS485 Address

The RS485 address of controller can be changed with this telegram:

<table>
<thead>
<tr>
<th>Master:</th>
<th>SD</th>
<th>LE</th>
<th>LE</th>
<th>SD</th>
<th>DA</th>
<th>SA</th>
<th>FC</th>
<th>DSAP</th>
<th>SSAP</th>
<th>new_addr</th>
<th>ID_Hi</th>
<th>ID_Lo</th>
<th>Lock</th>
<th>FCS</th>
<th>ED</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0x68</td>
<td>0x09</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0x43</td>
<td>0x37</td>
<td>0x3E</td>
<td></td>
<td>0x0</td>
<td>0x0</td>
<td>0x0</td>
<td></td>
<td>0x16</td>
</tr>
</tbody>
</table>

DA          Destination Address (= old Slave address)
SA          Source Address = Master Address (e.g. 0x01)
FCS         Checksum (sum of all bytes without SD, LE, LErep, SDrep, FCS, ED; without overflow, only 8 bits)
New_addr    New address (in range 1…126)

Answer Slave (short acknowledgement), on success:

SC          0xE5

No response:
No response indicates that an error has occurred in the address alignment. The controller still has the old address.

The new address is valid only after a reboot of the controller.
5.3 Commands and Settings

It can be made even more settings via the RS485 interface:
- Filter:
  - off
  - moving average (about 2 to 8 values)
  - arithmetic average (about 2 to 8 values)
  - Median (about 2 to 8 values)
  - dynamic noise reduction
- Data rate at which the measuring values can be added:
  - 5, 10, 20, 40, 80, 160, 320, 640, 1000 or 2000 Samples/s
- Baud rate of RS485 interface:
  - 9600, 115200, 230400, 460800 or 921600 Baud
- RS485 address of controller: 1 … 126
- Firmware Update of controller

Use for these settings either our MEDAQLib driver or the IF1032/ETH interface converter to Ethernet with the appropriate configuration option via web interface.
6. **Operation**

Connect the display/output devices through the signal output socket, see Chap. 4.6, before connecting the device to the power supply and switching on the power supply.

The measuring system is delivered calibrated. Calibration by the user is not necessary.

Allow the measuring system to warm up for about 10 minutes before the first measurement.

**NOTICE**

The power supply may not exceed or continuously fall below the specified limits.

> Damage to or destruction of the sensor and/or controller

---

**Fig. 23 Signal characteristic in the measuring range**

Disconnect the power supply before touching the sensor surface.

> Static discharge

> Danger of injury

1) Digital interface with controller DT6120 or DT6120/ECL2 only.
7. Maintenance

Make sure that the sensor surface is always clean.

➤ Switch off the power supply before cleaning.

➤ Clean with a clamp cloth; then rub the sensor surface dry.

Disconnect the power supply before touching the sensor surface.

> Static discharge

> Danger of injury

If the controller, the sensor or the sensor cable is defective, please send us the effected parts for repair or exchange. In the case of faults the cause of which is not clearly identifiable, send the whole measuring system back to

MICRO-EPSILON MESSTECHNIK
GmbH & Co. KG
Königbacher Str. 15
94496 Ortenburg / Germany

Tel. +49 (0) 8542 / 168-0
Fax +49 (0) 8542 / 168-90
info@micro-epsilon.de
www.micro-epsilon.com

Sensors of the same type can be replaced without calibrating the controller.
8. Liability for Material Defects

All components of the device have been checked and tested for functionality at the factory. However, if defects occur despite our careful quality control, MICRO-EPSILON or your dealer must be notified immediately.

The liability for material defects is 12 months from delivery.

Within this period, defective parts, except for wearing parts, will be repaired or replaced free of charge, if the device is returned to MICRO-EPSILON with shipping costs prepaid. Any damage that is caused by improper handling, the use of force or by repairs or modifications by third parties is not covered by the liability for material defects. Repairs are carried out exclusively by MICRO-EPSILON.

Further claims can not be made. Claims arising from the purchase contract remain unaffected. In particular, MICRO-EPSILON shall not be liable for any consequential, special, indirect or incidental damage. In the interest of further development, MICRO-EPSILON reserves the right to make design changes without notification.

For translations into other languages, the German version shall prevail.

9. Decommissioning, Disposal

- Remove the cable for electrical power and output signal from the controller.

Incorrect disposal may cause harm to the environment.

- Dispose of the device, its components and accessories, as well as the packaging materials in compliance with the applicable country-specific waste treatment and disposal regulations of the region of use.
