## interferoMETER 5600

-  Distance measurement with subnanometer precision
-  Best-in-Class: Resolution < 30 picometers
-  Absolute measurement, suitable for step profiles
-  Compact and robust sensors with large offset distance
-  Measuring rate up to 6 kHz for high speed measurements
-  Ethernet / EtherCAT / RS422 / PROFINET / EtherNet/IP
-  Flexible industrial integration

### Designed for high-resolution distance measurements in clean rooms & vacuums

The IMS5600-DS absolute interferometer is used for distance measurements with maximum precision. The controller offers a special calibration with intelligent evaluation and enables absolute measurements with subnanometer resolution. This includes measurement tasks with the highest accuracy requirements, for example in electronics and semiconductor production. For vacuum applications, Micro-Epsilon offers special sensors, cables and feedthrough accessories. These sensors and cables are particle-free to a high degree and can even be used in UHV.

### Absolute distance measurements with a large measuring range and offset distance

The IMS5600-DS system is used for high-precision displacement and distance measurements. The system provides absolute measurement values and can therefore also be used for distance measurement of step profiles. Thanks to the absolute measurement, sampling is performed without signal loss. When measuring on moving objects, the differences in height of heels, steps and depressions can thus be reliably detected. The measuring system offers sub-nanometer resolution with a large offset distance in relation to the measuring range.

### Multi-peak distance measurement

With multi-peak distance measurements on transparent objects, up to 14 distance values can be evaluated. For example, the distance between the glass and the mask can be determined. If required, the controller can calculate the glass thickness based on the peaks.

 14 distance values in the 2.1 mm measuring range

#### Multi-peak distance measurement

With multi-peak distance measurement, up to 14 distance values can be evaluated. This allows the distance between the glass and the mask to be determined.

ø10 mm

Due to their compact size, these sensors can also be integrated into restricted spaces.

### Absolute measurement of step profiles

Due to the absolute thickness measurement, step profiles are detected with high signal stability and subnanometer resolution.

## Adjustable mounting adapter

The adjustable JMA mounting adapter simplifies the alignment and fine adjustment of interferometric sensors. The sensors and adapters can be integrated into the machine and aligned directly on site. This corrects, e.g., minor deviations caused by mounting and compensates for tilted measuring objects. With two-sided thickness measurements, the mounting adapter supports the fine alignment of the two measuring points.
